Sympathy to those who voted for me, campaigned for me, or supported me in any way, both County. Vance, and ask everyone to stand be-

Michelle worked hard and ran a good race. I would like to take this opportuni

which can damage the optic nerve and destroy all vision in

The retina, a membrane that lines the back and side of the eye, contains photoreceptors that convert light into neural signals. The retina is vulnerable to damage from various conditions, including high blood pressure, diabetes, and smoking. The retina is the thin layer of tissue that lines the back of the eye and contains photoreceptors that detect light and convert it into electrical signals that are sent to the brain. When the blood vessels in the retina are damaged or blocked, the retina may not receive enough oxygen and nutrients, leading to vision loss. The retina is also sensitive to changes in blood flow or blood pressure. When the blood vessels in the retina are damaged, the retina may not receive enough oxygen and nutrients, leading to vision loss or blindness.

Hypertension itself is a silent disease, rarely causing symptoms, which can lead to serious complications. According to the American Heart Association, hypertension is a leading cause of death and disability in the United States. It is estimated that one in three adults in the United States has hypertension, which is defined as a blood pressure of 140/90 mmHg or higher. Hypertension can lead to serious complications, including heart disease, stroke, and kidney failure. The American Heart Association recommends that adults over the age of 18 have their blood pressure measured at least every 2 years, or more often if they have risk factors for hypertension or have been diagnosed with hypertension.
